Trevor J. O. Dick, John E. Floyd : Canada and the Gold Standard: Balance of Payments Adjustment under Fixed Exchange Rates, 1871–1913 (Studies in Macroeconomic History) before purchasing it in order to gauge whether or not it would be worth my time, and all praised Canada and the Gold Standard: Balance of Payments

Adjustment under Fixed Exchange Rates, 1871–1913 (Studies in Macroeconomic History):

In this re-examination of Canada's balance-of-payments experience under the gold standard, the authors develop and empirically test a new portfolio approach to the mechanism of balance-of-payments adjustment. This adjustment mechanism responded to massive inflows of foreign capital during a critical period of Canada's economic growth in the early years of the twentieth century. The authors show that the existence of international mobility of capital requires a fundamental revision of the price-specie-flow theory that has traditionally been used to explain adjustment when the balance of payments was more nearly dominated by the balance of trade. The approach taken by Professors Dick and Floyd not only answers the critics of Jacob Viner, who first explored the Canadian case after 1900, but also offers a new perspective on how the gold standard in general actually worked. This new interpretation of the Canadian experience is an extension of the monetary approach to balance-of-payments adjustment that realizes the full implications of international capital mobility. Interest-rate differentials do not drive capital flows, but instead reflect risk premiums set by the exchange of imperfectly substitutable securities of different countries in world-asset markets. Changes in domestic relative to foreign price levels equalize markets for goods, but to any fixed exchange-rate system when capital is internationally mobile.

"Dick and Floyd, two respected economists, have written an interesting and challenging interpretation of how the Canadian economy functioned under the gold standard during a period of massive capital flows as much as they reflect risk differences between imperfect security substitutes in the world's money markets...A must acquisition for any collection on international capital theory, international economics, or general economic theory." Choice "...constitutes an important and provocative analysis of the Canadian adjustment process under the gold standard." Georg Rich, Journal of Economic History
