CuneoThe book is a comprehensive review of the venture capital industry and provides insights for investors on how to participate in it; it also offers interesting advice for fund managers in raising capital and improving the investment process. Lou Gerken is at ease in explaining success stories and failures, and shows how to learn from both. However, one area where the book doesn't go deep enough is whether investing in venture capital funds is today worth the associated risks: the only statistical evidence offered is a single page summary of returns prepared by Cambridge Associates but those statistics are biased because they do not include the negative returns of the funds that failed and also are deeply affected by the selection of the reference periods and of the benchmarks. If it was possible to access the internal statistics of some of the largest investors, such as CALPERS (more than euro; 60 billion invested in hundreds of private equity and venture capital funds in a period of 20 years), one could have a truer view of the trend in average returns to investors because they are based on hundreds of investments of different vintages; those statistics normally show that in recent years (i.e. after 2004) the returns have decreased to the point that, considering the risk involved in venture capital and private equity, it may no longer be wise to invest in that sector. The venture capital and private equity professionals, both on the side of the limited partners and of the general partners, obviously do not share that view, which would mean the end of their jobs; they claim that recent results are affected by the J curve (i.e. in the initial life of the fund there are many costs and no exits, and the investments made are valued at the initial book value, thus underestimating - hopefully - the value creation underway) and, most importantly, they claim that all the funds that have been affected by the 2009/10 crisis (i.e. almost everyone) should not be counted in the statistics because of the unprecedented and non recurring situation of the crisis. The common belief is that sooner or later the average returns will match the comfortable double-digit levels of 10 years ago; that is a real leap of faith and the book doesn't explain why it should be so. It is quite possible that today's external conditions are substantially different than yesterday's; in the end, making money in an industry (adjusted for risk) depends on the demand/supply in that industry, i.e. whether there is an oversupply of capital chasing a limited supply of deals, and the size/duration of the unbalance. Up to 2008 there was an irrational exuberance that allowed many venture capital funds to be quite successful and the big question is if that condition is present today or will continue in the future. Gerken however offers an interesting insight on how to select the fund managers that have the highest probability of making money even if the industry itself doesn't offer the expectation of returns higher than the cost of capital. That part is the most valuable and original contribution of Gerken, and it quite credible because it is based on his successful professional experience.

This book is not only a must-read for those aspiring to a career in venture capital, but also for entrepreneurs seeking to raise venture capital. Entrepreneurs (myself included) ordinarily do not appreciate the challenges unique to VCs, namely the struggle involved in raising a fund, appraising opportunities across a wide-range of technologies, and overseeing portfolio companies. "Venture Capital Investing" book does an excellent job in terms of helping entrepreneurs understand those challenges. Again, I think it is an invaluable resource for those in the start-up community, regardless of which side of the table you sit on!
